### Abstract:

**Background:** Stroke is the 4<sup>th</sup> leading cause of death worldwide. Dysphagia in stroke occurs about 51% worldwide. Dysphagia is caused due to delayed triggering of the swallowing reflex, reduced pharyngeal peristalsis and reduced lingual reflex. There are different treatment approaches for treating dysphagia such as Rehabilitation Swallowing Therapy (RST), Transcutaneous Electrical Nerve Stimulation (TENS), NMES, RST includes postural adjustment, supraglottic swallowing, Mendelsohn Maneuver and effortful swallowing. TENS is applied to cause the muscle contraction and to stimulate sensory pathways. **Method:** in the present study 30 patients were taken and random in two groups, group A (n=15) RST and group B (n=15) TENS respectively. Outcome measures used were MMSE, FIM, STREAM, and FOIS. **Result:** In the present study RST was more effective than TENS statistically proved with unpaired t test MMSE (p=0.0115), FIM (p=0.929), STREAM (p=0.5775) and FOIS (p=0.068). When comparison was done within the group, all outcome measures showed non-significant values at pre and post intervention. MMSE (p=0.0005 in group A and B), FIM (p=0.0273 in group A and B), STREAM (p=0.0005 in group A and B) and FOIS (p=0.0001 in group A and B). **Conclusion:** RST showed more effect than TENS in post-stroke dysphagic patients

*Keywords: Stroke, Dysphagia, TENS, RST.*

## I. INTRODUCTION

Stroke is sudden loss of neurological function caused by an interruption of the blood flow to brain. Stroke is 4<sup>th</sup> leading cause of death. Loss of consciousness at stroke persistent serves hemiplegia, multiple neurological deficits and history of persistent stroke are also important predictor of mortality. <sup>[1,2]</sup>

Dysphagia is an inability to swallow or difficulty in swallowing. Dysphagia is stroke occurs about 51% worldwide. Most common problems seen in patients with dysphagia include delayed triggering of the swallowing reflex, reduced pharyngeal peristalsis and reduced lingua reflex. <sup>[1]</sup> Dysphagia involves the synergistic action of at least 32 pairs of muscles and depends on the integrity of sensory and motor pathways of several cranial phases involved in swallowing that is oral, pharyngeal, esophageal. <sup>[2]</sup>

In the oral stage food is continued within the mouth with mastication, mixing with saliva and formation of bolus. In the pharyngeal phase, respiration is momentarily during expiration. In the esophageal phase. Co-ordinate peristalsis carries the bolus through the lower esophageal sphincter into the stomach. The whole process of swallowing lasts approximately 12sec. <sup>[2]</sup>

There is good evidence for the existence of a brainstem swallowing Centre located in the medullary reticular formation on either side of the midline and just dorsal to the inferior olives. <sup>[2]</sup>

Swallow related cortical activity is multidimensional, recruiting brain area implicated in the processing of motor, sensory, attention and affective aspects of the task. Functional imaging studies have provided evidence that there is significant interhemispheric asymmetry in the motor control of swallowing. <sup>[3]</sup>

Rehabilitation swallowing therapy (RST) is compensatory techniques including postural adjustment, supraglottic swallowing the Mendelsohn Maneuver and effortful swallowing have been reported as the standard treatment for stroke survivors with dysphagia. <sup>[4]</sup>

Transcutaneous Electrical Nerve Stimulation (TENS) activates a general proportion of type II muscle fibers that produce higher level of tension that will enhance strength development more in voluntary contraction, the smaller type I muscle fiber are mainly activated. <sup>[5]</sup>

## II. RESEARCH METHODOLOGY

In the present study 2 groups were compared between RST (group A) and TENS (group B). The patients were allocated in groups by random block method using envelopes. All the patients selected were evaluated on the basis of Outcome measure scales i.e. MMSE, FIM, STREAM, FOIS. In group A RST by incorporating Mendelsohn's Maneuver was given for 20mins, 6 days a week for 2 weeks and for group B TENS was applied in the region of suprahyoid and infrahyoid muscles around the thyroid cartilage for the same duration as for group A. During the 1<sup>st</sup> 4 days, 20 contractions were given with rest period of 20sec in between followed by 30 and rest period reduced to 15sec for the next 5 days. In the last 5 days contractions were raised up to 40 with the rest period reduced to 10sec. All the post treatment parameters were measured at the end of 2<sup>nd</sup> week.

### 2.2. Population and sample:

The sample size was calculated using G-power software. Total 35 participants were at the baseline for the study based on the diagnosis of RCI in the MGM school of Physiotherapy Neuro physiotherapy OPD and MGM Hospital. Then on the basis of inclusion and exclusion criteria 30 were included out of 35 for the study.

PRINCIPAL

Revgaon Road, Rohanwadi, Jainas

## 2.2. Data and Sources of Data:

For this study secondary data has been collected. The data was collected from PubMed, google Scholar and Cochrane. The data collection period was for 6 months.

## 2.3. Descriptive statistics:

Descriptive statistics was calculated and analyzed by using Graph pad software. Shapiro-Wilk test was carried out to determine the normality of the data ( $p > 0.5$ ), considering all the normal distribution paired t-test was using to compare the groups within and unpaired t-test was used to compare between groups using MMSE, STREAM, FOIS and FIM.

# I. RESULTS

## 1.1 Results of Descriptive Statics of Study Variables

All the 30 participants completed the study whereas 3 dropped out after 1<sup>st</sup> week due to medical conditions. After performing the normalcy tests paired t test was used for intragroup comparison which wasn't significant in any of the outcome measures while comparison between two groups using unpaired t-test showed significant results for FIM, STREAM and FOIS and was non-significant for MMSE. The statistical results for each outcomes measures are shown in the tables below.

Table 3.1 Descriptive Statistics (MMSE)

Variables	Paired Difference		t-value	p-value
	Mean(SD) Group A	Mean(SD) Group B		
Pre	19.2 ±6.64159	20.8 ±3.18927	0.974	0.0133
Post	21 ±6.425396	25±3.11677	1.092	0.0115

## II. DISCUSSION

The purpose of the present study was to see the effect of rehabilitation swallowing therapy vs TENS for dysphagia on post stroke patients. The study was done on 30 patients who were randomly selected and were divided into 2 groups A and B. Group A was for rehabilitation swallowing therapy (RST) and group B was for TENS given for 2 weeks

### Gender

In the present study there were total 15 participants in each group in which Group A had 7 females and 8 males and in Group B it was the same. A similar study done by Spronson L. also had similar number of patients in both their groups that is 15. Our study showed statistically equal distribution of both male and female in both groups who underwent PT treatment for 6 consecutive days for 2 weeks.

### Outcome Measures

#### MMSE

Mini mental scale examination (MMSE) is a scale used in our research to test cognitive function of the stroke patients. MMSE has a good reliability and validity and so was selected as one of the outcome measures for our research work. According to a study by Kwang Jae Yu (2018) on different clinical predictors of aspiration pneumonia in dysphagic stroke patients which suggest that MMSE showed good results and other study by G.M.S.<sup>[25]</sup> proves that MMSE was not significant in their research. Our study when compared to these had a less duration of treatment protocol and so did not prove much significant. The patients in our study groups had a low MMSE score pre-treatment and so were not able to understand the treatment protocol and were less co-operative too and hence there was no marked improvement in the MMSE scores post treatment in both the groups.

#### FIM

One study done by Hamilton BB on the 7-level functional independence measure (FIM) shows clinically significant improvements in functional independence and quality of life.<sup>[28]</sup> Another study done by Mizrahi EH, et al<sup>[30]</sup> (2016) on ischemic stroke using FIM as an outcome measure proved similar results. In the study<sup>[30]</sup> pre-admission scores of FIM were not much higher but later during discharge the FIM showed significant improvements in the patients. Our result when compared to this study<sup>[28]</sup> shows similar outcomes when evaluated post treatment with FIM scores showing RST more effective than TENS. The results prove so because the patients in RST group were more co-operative and were able to tolerate the RST measures such as Mendelsohn maneuver, effortful swallowing more easily than TENS which was a bit uncomfortable for the patients.

#### STREAM

Stroke Rehabilitation Assessment of Movement is a measurement tool used to quantitatively evaluate the recovery of voluntary movement and mobility post stroke. When the comparison within two groups was done there was significant improvement in both groups which is proved statistically. Studies done by Ahmed S. et. al<sup>[26]</sup> (2003). Vongsirinararat M, et. al.<sup>[27]</sup> (2016) reveals similar results as our study where there is significant improvement is post treatment STREAM scores. Our results reveal that RST was more beneficial than TENS. RST is effective for activation for swallowing muscles and opening of the upper esophageal sphincter but statistically not significant. The patients in our study group had a very less STREAM score which suggest that they had a sever level of stroke but post treatment Group A showed good improvements in the score and is also supported by 2 other studies.<sup>[26, 27]</sup>

#### FOIS

Functional Oral Intake Scale is an outcome measure of our research chosen to estimate changes in the functional eating abilities of stroke patients over time. When the comparison was done within Group A and B between there was no significant result in both groups. According to a study done by Permsirivanich W<sup>[4]</sup> (2009) shows that they received positive results in FOIS levels. Another study done by Huang YC et al (2018) on swallowing therapy shows good results using the FOIS scale as an outcome measure. Our results when compared to this study did not show much improvement in the patients due to several limitations in our research work such as our

study had a smaller duration of treatment plan as well as some patients did not co-operate throughout the sessions. Group A (RST) showed good results post treatment as the patients were able to tolerate the treatment and were co-operative during the treatment sessions as compared to TENS where patients did not co-operate much during the sessions.

### III. CONCLUSION

This study concludes positive effects of RST and TENS for improving dysphagia in post-stroke patients after 2 weeks of treatment. RST showed better results as compared to TENS in improving dysphagia, it also increases tongue base retraction which improves swallowing in post stroke patients.

### IV. ACKNOWLEDGEMENT

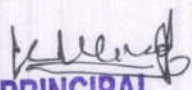

- 6.1. *Ethical community*: Ethical community approval was provided by MGM School of physiotherapy.
- 6.2. *Statistics*: Statistics were calculated by the department of physiotherapy statistician.
- 6.3 *Funding*: Financial support was provided by the School of Physiotherapy.

## The Prevalence Of Fall Using Time Up And Go Test In Community Dwelling Elderly Adults In Jalna District.

Neha Nilesh Lavhade <sup>1</sup>- Assistant Professor at Ojas college of Physiotherapy , Jalna

Monali Jadhav <sup>2</sup>- Assistant Professor at Ojas college of Physiotherapy, Jalna

### Abstract:

**Introduction:** Falls are a common complication as people grow older. As many as one-third of community-residing people over the age of 65 fall each year<sup>1</sup>. That number grows to 60% once a person begins living in a nursing home or assisted living facility. Falling can cause pain, fractures, soft tissue injuries, and functional limitations. It can also cause feelings of helplessness, depression, and loss of confidence in those who have fallen.

**Aim:.** To see the Prevalence of Fall Using Time Up and Go Test in older adults.

**Study design:** Cross sectional study.

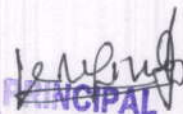

**Study setting:** Senior Citizen Club, Old Age Home

**Study population:** Patient Aged 60 and more

Both genders.

Sample size: 150

  
PRINCIPAL  
Ojas College of Physiotherapy  
Revgaon Road, Rohanwadi, Jalna

Outcome Measures: Time Up and Go Test.

Procedure : Consent was taken from participants. The participants were selected on basis of inclusion and exclusion criteria. Outcome measures were taken .Three trials were performed and the mean time was calculated. The data is analysed and recorded.

Result: The analysis was done using GraphPad Instat 3.

For analysing the correlation between the time up and go test score and Age Pearson correlation test was applied.

Conclusion: There is increase number of risk of fall in community dwelling elderly adults jalna district and further management has to be done to reduce the fall risk.

## Introduction:

Globally, the population is ageing and the World Health Organisation (WHO) predicts that, by 2050, the population aged 60 years or more will be double and those aged 80 years or more will number 400 million persons. This extension of the lifespan is looked upon as a triumph of medical advances, stemming from access to better treatments as well as a focus on preventive therapies<sup>4</sup>

Ageing causes various structural and functional changes in body which can lead to balance disorders and increases the risk of falls. Structural and functional changes in the foot has been seen which includes deformities , increased soft tissue stiffness , decreased range of motion, and decreased strength, increased risk of falls , reduced joint mobility, reduced gait speed, and less efficient and stable walking, ultimately worsening the quality of life of older individuals<sup>3</sup>

The World Health Organization [WHO] (2017) defines a fall as “an unexpected event where the participant comes to rest on the ground, floor, or lower level”. Falls are a common complication as people grow older. As many as one-third of community-residing people over the age of 65 fall each year<sup>1</sup>. That number grows to 60% once a person begins living in a nursing home or assisted living facility. Falling can cause pain, fractures, soft tissue injuries, and functional limitations. It can also cause feelings of helplessness, depression, and loss of confidence in those who have fallen<sup>2</sup>.

The Timed-Up and Go test is the most used test worldwide. This test measures the dynamic balance and functional mobility in older adults, as well as in the neurological population. The TUGT is a simple test that can be performed anywhere and consists of a patient getting up from a chair from the sitting to the bipedal position, walking three meters, turning, returning, and sitting on the chair again. The variable measured is the total time taken by the test, and then the score assigned in seconds is observed, which is correlated with the risk of falls <sup>6</sup>.

### Need of Study:

As stated by Grimmer M, Riener R in today's culture, the number of persons aged 60 and up is rapidly increasing. Every year, over one-third of the older individuals in a community die, and the rates of death are increasing with age. In the health of senior people, balance and gait speed are essential factors. Gait speed and balance issues are widespread in the elderly, and they are a leading cause of falls in this group. They are associated with increased morbidity and mortality, as well as reduced level of function. Falls have been linked to problems with balance and gait. The present study helps us to determine the prevalence of fall in community dwelling elderly adults in jalna district.

**Aim:** To see the Prevalence of Fall Using Time Up and Go Test in older adults.

### Objectives:

The Prevalence of Fall Using Time Up and Go Test in older adults.

### Methodology:-

Ethical clearance: Ethical committee approval was obtained before the commencement of the study.

Study design: Cross sectional study.

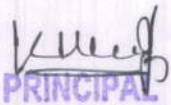

Study setting: Senior Citizen Club, Old Age Home

Study population: Patient Aged 60 and more

Both genders.

Study duration: 3 months.

  
PRINCIPAL  
Ojas College of Physiotherapy  
Revgaon Road, Rohanwadi, Jalna

Sample size: 150

### Inclusion Criteria:

1. Community dwelling elderly individuals with more than 60 years of age.
2. Older adults who is resident of jalna district.
3. Elderly with mini mental score  $\geq 25$ .

### Exclusion Criteria:

- Elderly individuals having the following;
  1. Cognitive impairment.
  2. Current history of dislocation of lower limb.
  3. Fractures of lower limb, within 6 months prior to inclusion.
  4. Neurological disorders.
  5. Malignancy.
  6. Bone diseases.
  7. Excessive pain
  8. Hypermobility of ankle joint.
  9. Recent injury to ankle joint.

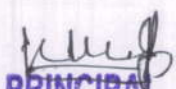

### Outcome Measures:-

1. Time up and Go Test.

The subjects were asked to sit on a corner chair, and the time it took for the subjects to get up and touch the wall 3 meter in front them, return and sit on a chair again was measured. Three trials were performed and the mean time was calculated. Subjects scoring greater than 13.5 were considered as high risk fallers.

## Procedure

**Recruitment of samples:** Samples were recruited according to inclusion and exclusion criteria.

## Material used:

Chair, Paper, Pen, Stop Watch.

## Evaluation:

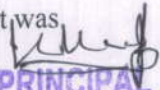

- Instructions were given to the participants about study and its benefits and risk in their own language.
- Consent was taken from participants.
- The participants were selected on basis of inclusion and exclusion criteria.
- The subjects were asked to sit on a corner chair, and the time it took for the subjects to get up and touch the wall 3 meter in front them, return and sit on a chair again was measured.
- Three trials were performed and the mean time was calculated.
- Subjects scoring greater than 13.5 were considered as high risk fallers and were included in the study<sup>5</sup>
- The data is analysed and recorded.

## STATISTICAL ANALYSIS

The analysis was done using GraphPad Instat 3.

For analysing the correlation between the time up and go test score and Age Pearson correlation test was applied.

	Mean Score	Mean Score	Mean Score
Male	15.9	16.17	21.1
Female	17.89	20.2	23.45

Graph 3 : TUGT Score in Different Age Group

### Discussion

The study was intended to see the Prevalence of Fall Using Time Up and Go Test in older adults. It has been found that there is increase number of risk of fall in jalna district.

According to a study by Pavlos Morfis et al. from 2021, ageing and changes in gait characteristics are related to falling in the elderly. In their study they observed alterations in the walking pattern of elderly, they indicate decreased plantar flexion peak ankle in late stance compared to young participants. This condition is likely to contribute to older person’s shorter step length. Thus has a risk of fall. This is due to the age-related changes in gait that are brought on by diminished muscle strength and restricted range of motion in the lower limb joints as a result of physiological and neuromuscular changes &

*[Signature]*  
**PRINCIPAL**  
 Ojas College of Physiotherapy  
 Revgaon Road, Rohanwadi, Jalna

Joint physiology changes with age, including a decrease in cartilage water content, synovial fluid volume, and proteoglycans. Crosslinking occurs in the collagen fibres of cartilage, resulting in increased stiffness. These changes could explain why elderly adults have a restricted range of motion in their lower extremity joints<sup>3</sup>. A study by Chiara Mecagni, Janet et.al (2000) indicated a direct relationship between Dynamic balance and a low range of motion in joints. Reduced range of motion results from the tissues around the joints, particularly in the lower extremities, which affect the dynamics of this muscle in walking and increases the risk of falling.

## Conclusion

Thus it has been concluded that there is increase number of risk of fall in community dwelling elderly adults jalna district and further management has to be done to reduce the fall risk.

## Limitation

Risk Factors were not included in the study.

## Future Scope

Management for Reducing the fall risk can be included in future studies.

## Abstract

Hemiplegia is the medical term for paralysis of one side of the body. It results in muscular wasting on the affected side, impairs gait, reduces motor abilities, and causes instability and a loss of grasping capacity. The patient's quality of life is impacted by hemiplegia because it impairs brain and spinal cord functions. Consequently, a range of therapeutic options, including physical therapy, medical health management, and other multidisciplinary care, are accessible. The effects of treatments on juvenile patients with hemiplegia who are participating in a randomized controlled trial (RCT) are examined in this systematic review. Using the Boolean operator "AND," the research process entailed searching for keywords like "Hemiplegia" and "Pediatrics." Based on the inclusion and exclusion criteria, a total of six RCTs were included in the study. According to the study's findings, hemiplegic patients benefited from Kinesio taping (KT), botulinum toxin type-A (BoNT-A), hyaluronic acid injections, and bimanual treatment.

Categories: Internal Medicine, Medical Education, Other

Keywords: pediatric, randomized controlled trial, systematic review, kinesio taping, hemiplegia

## Introduction And Background

Hemiplegia is a nonprogressive disorder that results in paralysis on one side of the body and is caused by brain or spinal cord trauma. Depending on the location and severity of the injury, the degree of hemiplegic symptoms varies. Congenital hemiplegia refers to the onset of hemiplegia before, during, or within the first two years of life. Acquired hemiplegia is a term used to describe hemiplegia occurring later in life [1].

Hemiplegia is caused by conditions such as stroke, brain infections (by bacteria, fungi, or viruses), brain trauma, brain tumors, and rare mutation in genes (alternating hemiplegia). Hemiplegia is a more general name for cerebral palsy (CP), which develops before birth and manifests in the first few years of life. Other hemiplegia types include alternating, facial, spinal, contralateral, spastic, and spastic hemiplegia [1,2].

Depending on the degree, hemiplegia symptoms may include muscle stiffness or weakness on one side, spasticity or permanently clenched muscles, poor fine motor skills, difficulty walking, unsteadiness, and difficulty grasping objects. Additionally, hemiplegic children are less active and require more developmental years than healthy children do. Additionally, they are permitted to play with just one hand or to hold one hand in a fist. If brain injury results in hemiplegia, brain damage may result in symptoms other than hemiplegia, such as memory loss, difficulty focusing, speech problems, behavioral disorders, and seizures. Various treatment modalities are available based on severity such as physiotherapy, multidisciplinary rehabilitation such as physical therapy, mental health therapist, and other medical management [1]. This review was conducted to oversee the different interventional therapies and their effects on hemiplegia pediatric patients.

## Review

### Research methodology

The updated Preferred Reporting Items for Systematic Reviews and Meta-Analyses literature search extension (PRISMA-S) statement for reporting systematic reviews was used to conduct this systematic review [3]. We searched the PubMed, Cochrane Library, and Embase databases for randomized controlled trials (RCTs) published between 2012 and July 2022. The search terms from the two search topics were combined to search the database using the Boolean operator "AND." The many investigations that have been carried out on the pediatric population are quantified using the text words "hemiplegia," "pediatrics," and

Serial no.	Author name	Journal name	Database	Year	Country

5	Hastings-Ison et al. [6]	Wiley Journal	PubMed	2013	Australia
6	Hoare et al. [7]	Wiley Journal	PubMed	2012	Australia

TABLE 1: Information regarding the study's author name, year of publication, journal name, and place where the study conducted.

The comparison among the intervention groups and study outcome and the inclusion criteria of the study are shown in Table 2.

Serial no.	Author's name	Inclusion	Purpose	Study groups	Study outcome
1	Huang et al. [3]	n = 44, subacute stroke hemiplegia	The effects of KT on HSP, upper extremity functional outcomes, and reduction of soft tissue damage were assessed in subacute stroke patients with hemiplegic shoulders during rehabilitation.	Randomly allocated to the therapeutic KT and the control group (sham)	The findings show that kinesiology taping helps patients with HSP after stroke feel better by decreasing shoulder discomfort and subluxation, and boosting muscular activation and AROM.
2	Hastings-Ison et al. [4]	n = 42, ambulant children with spastic equinus, secondary to CP	For spastic equinus on passive dorsiflexion, the frequency of BoNT-A injections was evaluated and compared at 12 months versus four months.	The calf muscle got 12 monthly/four monthly injections of BoNT-A throughout a 26-month period after being randomly assigned. Additionally, 6 U/kg of Botox was administered into the gastrocnemius muscles of the affected limbs under mask anesthesia.	Passive dorsiflexion and secondary outcome indicators did not differ significantly between the injection regimens administered every 12 and every four months. For spastic equinus, a 12-month cycle of BoNT-A injections is recommended.
3	Huang et al. [2]	n = 26, subacute stroke patients	Motor function and pain alleviation in subacute stroke patients with HSP and damage affected by HA injection were assessed.	The experimental group (n = 16) received ultrasound-guided subacromial HA injections once weekly for three weeks as opposed to the control group (n = 10) received 0.9% sodium chloride injections once weekly for three weeks along with conventional rehabilitation.	Subacute stroke patients with HSP and damage may experience improvements in shoulder discomfort and abduction after receiving a subacromial HA injection.
	Friel et al.	n = 20, unilateral	Compared with unstructured practice, systematic skill training	The impact of bimanual therapy alternates between unstructured play-like hand	Bimanual hand use and dexterity significantly increased in both groups. The size of the motor map of the distressed hand and the magnitude of motor-evoked potentials increased only

PRINCIPAL

pre-application value, gait pace and step extent on the healthy side improved after half an hour of elastic taping. In conclusion, poststroke patients with weak ankle dorsiflexors showed increased gait speed and step length [15].

Another study included two centers to compare the frequencies of botulinum toxin type-A (BoNT-A) injections for spastic equinus. Equinus, which comprises contraction of the gastrocnemius or the muscle-tendon complex, is the most prevalent spastic abnormality in CP (triceps surae) [16]. It may be paired with an equino valgus deformity of the foot when pronation is present due to tense peroneal muscles or an equinovarus deformity when the tibialis posterior muscle is overactive or tense. Injections into the gastrocnemius muscles of both lower limbs were administered to children with spastic diplegia at a dosage of 6 to 12 U/kg. Under mask anesthesia and electrical stimulation, 6 U/kg of fixed-dose botox was administered intravenously into the gastrocnemius at one site in the lateral belly and two sites in the medial belly of the calf muscle [5]. The trial findings support the recommendation of a 12-unit monthly injection as therapy. In the end, 12-monthly injections are recommended for the treatment of spastic equinus in children with hemiplegia and diplegia [5]. Based on research, children with hemiplegia did not profit from an increase in the injection frequency. A transition to a permanent contracture that is unresponsive to more frequent injections occurs in early childhood. A similar study by Kanovsky et al. showed that for the group as a whole, BoNT-A injections every four months did not offer any benefit over injections every 12 months for spastic equinus [17]. Nevertheless, over the two-year study period, passive dorsiflexion was maintained in both therapy groups. This might imply a benefit compared to standard natural history, but it is impossible to prove this without a control group [17]. The loss of passive dorsiflexion in hemiplegic children who received injections every four months was 9.0° during the 26 months, compared to 8.1° for those who received injections every year. Children with hemiplegia who receive injections three times per week develop contractures. When a fixed contracture form, the study advised stopping BoNT-A injections and referring patients as soon as possible to surgically extend the contracture [5].

Patients with acute stroke and flaccid shoulders frequently experience HSP. HSP lessens the length of hospital stays, quality of life, and functional recovery following a stroke. HSP in stroke patients has been treated with a variety of interventions, including physical modalities, exercise, medicine, and localized injections [18].

In another study, HSP is associated with rotator cuff injuries and can be treated with steroids or hyaluronic acid to relieve pain. In the interventional group, the subdeltoid bursa was injected with 2.5 mL of sodium hyaluronate under ultrasound guidance, while the subdeltoid bursa was injected with 2.5 mL of 0.9% sodium chloride for the control group and was also enrolled in the inpatient rehabilitation program. No negative outcomes, such as tendon ruptures and tissue deterioration, occurred, and rotator cuff injuries patients received superior care. The RCT did not include a longer follow-up duration for patients with stroke who received HA injections. As the sample size was small and only included patients from one center, this study did not record the specifics of the physical modalities used for HSP pain management [2].

Patients with unilateral spastic CP (USCP) have weakness and motor dysfunction due to injury to the developing brain. Improving hand function is a key priority for the majority of children with USCP and can be addressed by intensive bimanual therapy or hand-arm bimanual intensive therapy (HABIT), which assesses the functional changes in the brain. In this study, the kids were divided into two groups for bimanual skill training that was both structured and unstructured. The study demonstrated that skill training with the aid of a motor map enhanced the positive aspects, such as the strength, functional performance, and size of the motor map of the affected hand. According to this study, neuroplasticity exhibits dichotomy. Although hand performance increased, there was no evidence of motor cortical plasticity in the unstructured practice group's transcranial magnetic stimulation (TMS) map. The 90-hour high dose may have eradicated the group differences. Variations between the groups could have been caused by lower dosages. Although the study found a connection between cortical plasticity and functional improvements, it is possible that at lower doses, the association with plasticity for the organized skill group might be stronger than that of the unstructured group. Although the groups were matched for age and Jebsen-Taylor test of hand function (JTTHF) baseline, the distribution of CST projection patterns showed differences between the groups, and the study only examined M1 plasticity. The study's limited sample size limits its generalizability [5].

The terms agreement and reliability are combined under the phrase *reproducibility*, which refers to the degree to which results from repeated measurements are consistent. An attribute of the measurement tool itself is agreement. Reliability is the capacity to distinguish between research components (participants), notwithstanding the measurement inaccuracy caused by participant variability.

The subtalar joint exhibited intricate and triplanar movements. Despite efforts to standardize coronal and transverse joint mobility while assessing passive dorsiflexion range with the knee extended (PADKE) in the sagittal plane in this study of young children, the standard deviation for assessments performed under anesthesia decreased for one assessor alone. When comparing the repeatability of PADKE in ambulant children with CP to previously published measures, the instrumented technique was successful in standardizing the applied torque. Reproducibility was enhanced when one of the two assessors was under anesthesia. The methodological shortcomings included time and budget limitations. Scientists found it

PRINCIPAL

There is no specific treatment for alternating hemiplegia (AH), but therapies mainly focused on reducing the frequency and severity of the episodes. Drugs such as flunarizine, benzodiazepines, chloral hydrate, melatonin, and rectal diazepam are usually prescribed [34,35].

There is a dire need for an early interventional program for treating developmental delays and disabilities at early stages of life that includes the cognitive, adaptive, community, physical, and communication development that improves the further life of young children [36].

The drawbacks of this study were that the included RCTs were from less than two sites and had a few participants; therefore, there might be chances of the Investigator's bias. Second, every single RCT had a unique design that was put into practice in various contexts, over various time frames, and with various control treatments. These variations may have developed because of the various interventions performed. Third, there is a possibility that the variety of measurements led to comparable heterogeneity. Finally, only less number of RCTs were enlisted; hence, it does not conclude the potential benefits of interventional therapy compared to conventional therapy in the management of hemiplegic patients.

## Conclusions

This study stated that there were differences in the outcome of each RCT. Therapies like KT, BoNT-A, hyaluronic acid injections, bimanual therapy, hand use, and systematic skill training showed better improvements in hemiplegic pediatric patients. Therefore, no significant outcome can be found as the intervention treatment group slightly showed a beneficial effect and improvements as compared to the control group and vice versa. Hence, more studies are needed for investigating and analyzing the importance of experimental tools in the RCT.

## Results

From the database searches, 1,135 published papers were identified. After examining the titles and abstracts, 32 RCTs about childhood hemiplegia were selected for free full-text review. Thus, using inclusion parameters, six RCTs were collected for a thorough review. However, the comparison among the different interventions on pediatric patients with hemiplegia and CP was evaluated through this study. Table 1 depicts the details about the studies involved, author's name, country, database, year of publication, and journals.

### ABSTRACT

**Background:** The Sacro Iliac Joint (SIJ) is a complicated joint that has been undervalued in terms of its role in lower back discomfort. Currently, the treatment of chronic Lower Back Pain (LBP) caused by SIJ is primarily conservative, with surgical indications. However, music therapy appears to impact mood and sentiments. When a patient is undergoing rehabilitation, this therapy is used. **Case presentation:** The 52-year-old female teacher was patient when she complained of Low Back Pain 5-6 months ago after lifting a heavy object. Her pain is described as a dull aching with periodic stabbing-shooting pain that radiates from her low back through her buttocks, groin, back of the leg, and feet. In this case, the right leg hurt more than the left. On the first day of pre-treatment, the VAS score for discomfort was 3/10 at rest and 9/10 at worst. In this case study, PT intervention was more conservative with music therapy to manage her pain. **Conclusion:** Music therapy is easily accessible, low-cost, and requires minimal training, and it may help patients with Sacro Iliac Joint dysfunction have a good result with conservative PT management.

**Keywords:** SIJ dysfunction, Music therapy, core stabilization exercises.

### Introduction-

LBP is one of the major medical conditions worldwide<sup>1</sup>. LBP is a persistent illness that can negatively affect a person's everyday life, and leads to disability<sup>2</sup>. Doctors have focused their attention on the SIJ, which is known as a common source of LBP. It is considered to be involved in 15% of all LBP cases<sup>3</sup>. 70%-80% of people today will experience Pelvic Girdle Pain [PGR] in their lives at some-point. SIJ have unique

anatomical traits that render them vulnerable to mechanical stress and make diagnosis difficult. Most patients who come to the clinic have LBP, and the majority of them are adults<sup>5</sup>. Sedentary and obese people are prone to develop SIJ dysfunction. It frequently results in aberrant mobility or misalignment of the SIJ<sup>6</sup>. The dysfunctions are well controlled by symptomatic therapy, along with Physiotherapy management. Music therapy is utilised

treatment was applied i.e. [Protection, Optimal loading, Ice, Compression and Elevation] Utilizing mobilization, movement treatment, and music therapy, the conservative goal is to enhance mobility. TENS and icepack electrotherapy modalities, as well as mobility exercises, were used in the first week of treatment. For patients with SIJ pain, manual therapy is a key goal for effective treatment<sup>7</sup>. At two to four weeks, music therapy was used along with core stabilization. When treating sacroiliac pain, exercise is an important component of the treatment plan, and core stability has been shown to be effective. The goal of treatment planning is to re-establish a sense of control and become actively involved in the management of her pain, which begins with music therapy. Her pain relaxation music is used to relax, as well as to alleviate worry, fear, sadness, withdrawal tension, and other unpleasant aspects of the pain experience. Since the patient was resistant to and afraid of exercising in the first way, further options for reducing her kinesiophobia were considered. We were able to incorporate and co-ordinate her exercise to the rhythm of the music during PT intervention with core stabilization exercise to promote compliance and activity participation by playing her favorite music during PT intervention with core stabilization exercise. The use of commenced in the fourth week and was followed by exercise. The patient chose his or her second favorite songs to be played during therapeutic exercise to encourage repeated contractions of a specific activity. She also speaks loudly while listening to music, providing a stimulus for her to enhance her respiratory control.

Figure:1.2A summary of the importance to educating the patient about physical therapy intervention

**Follow-up and outcomes –**

Outcomes used was VAS, MODI, Tampa scale.

Table- 1.2 outcome measures pre 1<sup>st</sup> week and 4<sup>th</sup> week

**Intervention adherence and tolerability-**

The patient adhered to the treatment schedule extremely well. By focusing on physical treatment and exercises, the patient actively participated.

**Adverse and unanticipated events-**

There have been no negative and shocking events.

**Strength associated with case report-**

Throughout order to diminish local symptoms, the treatment strategy focused on pain, muscular activation, tightness, and music therapy in patients with SI pain. Music is used to relax, as well as to alleviate worry, fear, depression, withdrawal tension, and other unpleasant components of the pain experience. The relevance of this physical therapy technique for SIJ pain relief.

**Weakness associated with case report-**

Core stabilization exercise is something you have to know approximately.

**Discussion-**

This patient's diagnosis was SIJ dysfunction attributed to strenuous activity. And in a care context, the employment of a one-of-a-kind evaluation tool [TSK] and intervention component [music]. Despite the fact that the patient's performance was limited, she started gaining in strength and exercise tolerance. Developments in movement strategies, motor control are most easy to notice for these case report benefits. Physical intervention enhanced functional results, according to Anesse L et al 2019 they also highlight the use of non-traditional outcomes [TSK] and intervention strategies [music] in acute care settings<sup>8</sup>. The 2016 research by Jacqueline Redding et al, which supports the use of music therapy to improve patient comfort, is universally believed and used. Music therapy is easily accessible, low-risk, and low-cost, and with a greater understanding of evidence-based treatment, it may be able to lessen the need for moderate sedation while also improving the entire patient experience<sup>9</sup>. The music in this case report was chosen by the patient, which a recent qualitative study found to be significant for
